Nathan:

It just occurred to me a few minutes ago that I had an electronic copy of the monograph and was shaking my head about not giving that to you.

I just found the estimates of juvenile survival rates for OLY (So = 0.5977, SE = 0.215), TYE (So = 0.632, SE = 0.065), and CLE (So = 0.366, SE = 0.0816) in Franklin et al (1999). These estimates were computed by adjusting the apparent survival rates for juveniles with the estimates of emigration rates for that age class. They are found on pages 28-29 for that report. I was close but the range should be 0.37 to 0.63.

Bob

Hi Bob,

I've attached an electronic copy of the monograph (from the UW online library).

Nathan
